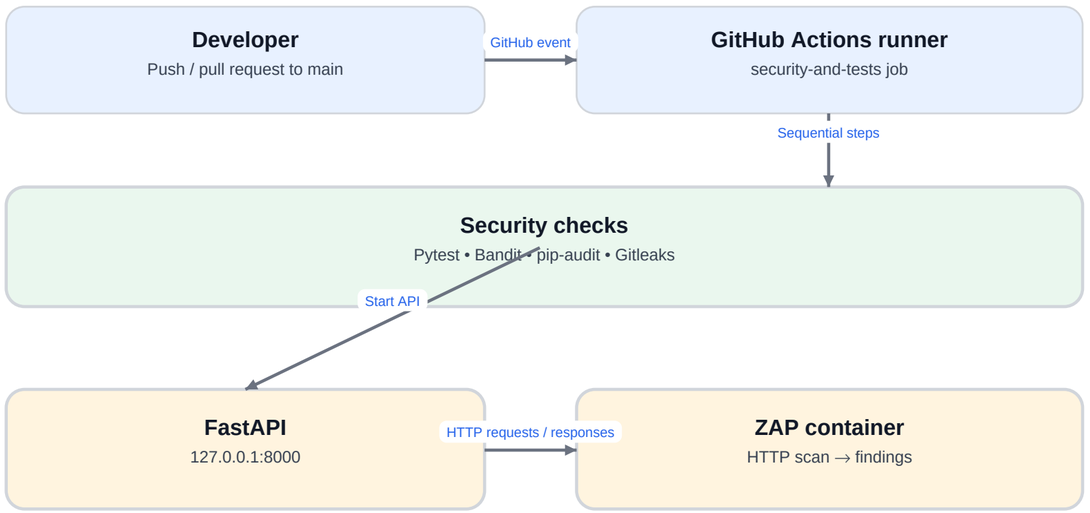
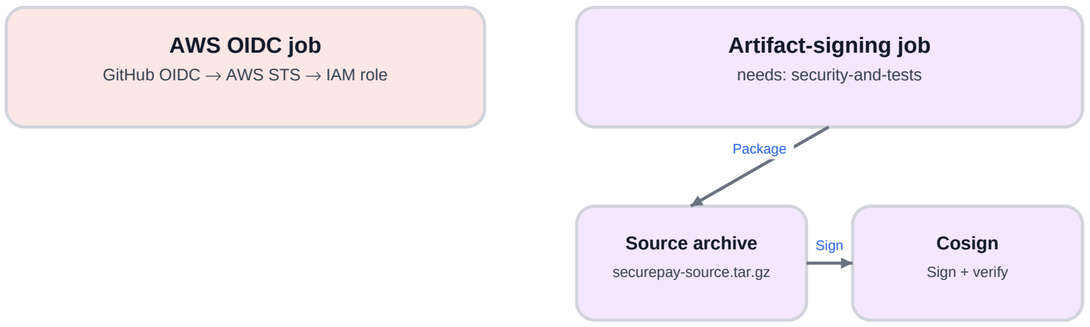
SecurePay — Phase 1 + Phase 2 Architecture

Secure software delivery and authenticated serverless API

PHASE 1 — SECURE CI/CD



Separate jobs — push to main only



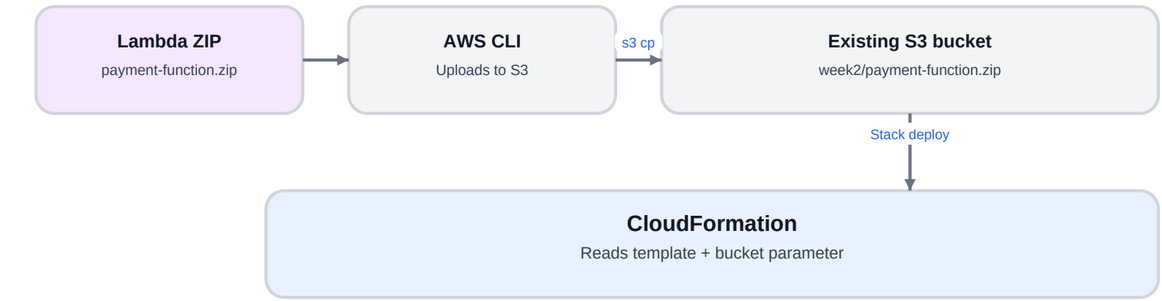
AWS OIDC: independent job; obtains temporary AWS credentials.

Cosign: keyless signature using GitHub OIDC; verifies workflow identity.

Pull request: security-and-tests only. Push to main: all three jobs.

PHASE 2 — SERVERLESS API

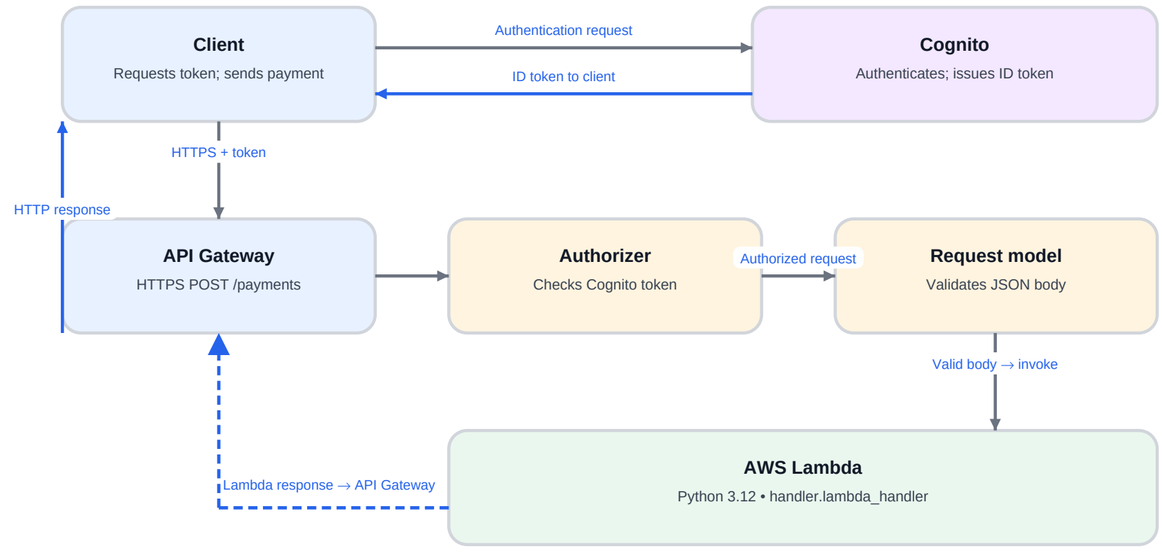
A. DEPLOYMENT



Creates Cognito • API Gateway • Lambda • IAM role/permission • API stage

Lambda Code references the S3 bucket and object key.

B. LIVE REQUEST / RESPONSE



Lambda invoke permission allows API Gateway to invoke the function.

Lambda execution role grants basic CloudWatch logging permissions.

S3 is used at deployment, not for each request. Payment is simulated.

The phases form one project lifecycle; Phase 1 does not directly call Phase 2 at runtime.
